

AI-ASSISTED APC LIBRARY PLATFORM: FULLY DRESSED USE CASES

Use Case Name:	1. User Login	
Scenario:	User securely authenticates into the APC E-Library system.	
Triggering Event:	User navigates to the login screen and clicks 'Login with APC Account'.	
Brief Description:	Allows users to log in securely to access personalized educational tools and materials via Microsoft SSO.	
Actors:	User (APC Student/Faculty)	
Related Use Cases:	None	
Stakeholders:	Students, Faculty, System Administrators, IT Department	
Preconditions:	User must have a valid APC Microsoft account.	
Postconditions:	User is authenticated and redirected to their personalized dashboard.	
Flow of Activities:	Actor	System
	1. User accesses the login page and clicks 'Login with APC Account'. 3. User enters valid Microsoft credentials.	2. System redirects user to the Microsoft sign-in page. 4. System receives authentication success from Microsoft. 5. System authenticates user and redirects them to their personalized dashboard.
Exception Conditions:	3.1 If user enters invalid credentials, Microsoft authentication fails, an error message is shown, and access is denied. 1.1 If user is already signed into Microsoft (SSO), they are automatically authenticated without re-entering credentials.	

Use Case Name:	2. View Personalized Recommendations	
Scenario:	User discovers relevant study materials generated and suggested by the AI engine.	
Triggering Event:	User navigates to the 'Catalog' section.	
Brief Description:	Continuously generates and manages personalized study material recommendations based on user activity.	
Actors:	User, AI Engine	
Related Use Cases:	Extends: Generate personalized recommendations	
Stakeholders:	Students, Academic Faculty	
Preconditions:	User is logged into their dashboard.	
Postconditions:	System displays recommendations; updates the user's interest list for future refinements.	
Flow of Activities:	Actor	System
	1. User navigates to the 'Catalog' section. 4. User interacts with an item (e.g., clicks 'Interested' or 'Not Interested').	2. AI engine analyzes user's recent reading history and course data. 3. System displays a curated list of personalized recommendations. 5. System updates user's interest list and uses data to refine future AI generations.
Exception Conditions:	2.1 If no user history is available, the system provides generalized popular materials.	

Use Case Name:	3. Interact with AI Chatbot / FAQ	
Scenario:	User queries the chatbot for instant AI-generated answers.	
Triggering Event:	User clicks the 'Chatbot' icon anywhere on the platform.	
Brief Description:	Allows users to interact with a chatbot to ask questions and instantly receive AI-generated FAQ answers to assist their studies.	
Actors:	User, AI Engine	
Related Use Cases:	Includes: Generate FAQ answer	
Stakeholders:	Students, Academic Faculty, Support Staff	
Preconditions:	User is active on the platform.	
Postconditions:	Relevant FAQ answer is displayed in the chat interface.	
Flow of Activities:	Actor	System
	1. User clicks the 'Chatbot' icon. 3. User types a question and presses 'Send'.	2. System opens a chat window and displays past conversation history. 4. System displays user's message in the log and routes query to the AI. 5. AI identifies the topic and generates a relevant FAQ answer. 6. System displays the answer in the chat interface.
Exception Conditions:	5.1 If AI cannot identify the topic, it prompts the user to rephrase their question.	

Use Case Name:	4. E-book Summaries Generation	
Scenario:	User requests an AI-generated summary of an e-book.	
Triggering Event:	User clicks the 'Generate Summary' button while viewing an e-book preview.	
Brief Description:	Generates a concise, accurate summary of reading materials so the user can quickly review core concepts without reading the entire text.	
Actors:	User, AI Engine	
Related Use Cases:	Includes: Generate e-book summaries (from View Book Preview)	
Stakeholders:	Students, Academic Faculty	
Preconditions:	User is viewing an e-book in the library catalog.	
Postconditions:	A concise summary of the e-book is displayed to the user in the chatbot modal window.	
Flow of Activities:	Actor	System
	1. User opens an e-book preview in the library. 2. User clicks the 'Generate Summary' button. 5. User views the summary in the chatbot modal window.	3. System sends a request to the AI to process the text. 4. AI processes the e-book's contents and generates a summary. 6. System receives the summary data and displays the text in the chatbot modal window.
Exception Conditions:	4.1 If the e-book format is not supported for text extraction, the system displays an error.	

Use Case Name:	5. Request Citation Format	
Scenario:	User generates a citation for an e-book to use in academic assignments.	
Triggering Event:	User selects 'Cite this Book' or 'Cite' a specific part and chooses a format (e.g., APA).	
Brief Description:	Automatically builds correct citations for e-books utilizing AI to extract metadata and format it according to academic standards.	
Actors:	User, AI Engine, Koha (Metadata Source)	
Related Use Cases:	Includes: Generate e-book citations	
Stakeholders:	Students, Faculty, Librarians	
Preconditions:	User is viewing e-book details. Valid metadata exists.	
Postconditions:	A correctly formatted citation string is displayed and available to copy.	
Flow of Activities:	Actor	System
	1. User views details of an e-book. 2. User selects 'Cite this Book' and chooses the desired format (e.g., APA, MLA).	3. System retrieves metadata from Koha and prompts the AI to build the citation. 4. AI extracts e-book metadata (Author, Title, Publisher, Date). 5. AI generates a formatted citation string based on the chosen style. 6. System displays the citation text in the chatbot modal window for the user to copy.
Exception Conditions:	4.1 If essential metadata is missing in Koha, the AI prompts the user to manually fill in the missing fields.
